

# Git Create and Clone

There are two ways to create a new online repository in GitHub<sup>1)</sup>:

- Create online and clone to PC
- Create on PC and push to git

The first approach is simpler as it requires less work and commands to accomplish a working repository.

## Create online and clone

- Create a new<sup>2)</sup> repository on GitHub
  - Add a readme
  - Add a license
  - Add a gitignore
- Click the green "Clone or Download" button and copy the new Git URL.
- Open a [command prompt](#) on the PC with the git installed and in the path
- Change to the directory where the repository should be cloned into
- Issue the git command 'git clone "<URL>"' where <URL> is the the link copied in the step above.

## Create on PC and push
